MAS–SNB RESEARCH · CLIENT ONE-PAGER

SGD has policy support. CHF borrowing still carries risk.

Singapore's appreciating currency policy can support SGD, but low Swiss interest rates do not protect a borrower from a stronger Swiss franc.

- **Two different policy holds:** MAS retains currency appreciation; SNB retains a 0% policy rate.
- **Inflation needs context:** Swiss underlying pressure remained below headline inflation.
- **Currency risk remains:** a stronger CHF raises the SGD cost of repaying CHF debt.

The evidence behind the view

At the report cutoff	Singapore / MAS	Switzerland / SNB
Policy stance	Appreciation path maintained 14 Oct 2026 decision	Policy rate held at **0%** 24 Sep 2026 decision
Headline inflation	**2.2%** September 2026	**1.5%** October 2026
Core inflation	**2.0%** · MAS core September 2026	**0.5%** · FSO core 1 October 2026

Inflation: % year-on-year; observation months differ. Core measures are not directly comparable: MAS excludes accommodation and private transport; Swiss core 1 excludes fresh/seasonal products, energy and fuel.

What could change the conclusion?

CHF can strengthen even with low rates. A market sell-off can trigger safe-haven demand or repayment of CHF-funded investments. Broader Swiss inflation or policy surprises can also strengthen CHF.

MAS does not target CHF/SGD. Its currency basket policy does not guarantee SGD gains against CHF.

> **Before borrowing in CHF:** check loan pricing, fees, repayment dates, hedges and collateral headroom. The SNB's 0% is not your borrowing rate. Falling investments and a stronger CHF can occur together.

Data cutoff: 6 November 2026, 17:00 Singapore time. Prepared 14 November 2026; data not refreshed. Currency view: analysis, not a guarantee or personalised advice.
